A dental phone bot says 'operator' first.

What a voice agent for a dental clinic has to preserve when it stops talking.

VOICE AI · 1 / 6

RULE 1 · THE EXIT WORD

The exit word comes before the first question.

The greeting discloses the AI and hands the caller the word 'operator' before asking anything.

voice_agents / vapi_dental_fr / create_assistant.py

```
"Hi, you've reached {CLINIC_NAME}. I'm Lisa, your
  assistant. "
"This call is handled by an AI. If you'd rather speak to
  a human, just say "operator" at any time. "
"For an emergency with severe pain, say "emergency". "
"How can I help you today?"
```

RULE 2 · SIX REASONS

Six transfer reasons, one transfer line.

Caller asks for a person. Emergency. Language mismatch. Hostile caller. Unclear audio after 2 spell-back tries. Tool failure.

VOICE AI · 3 / 6

RULE 3 · NO TOOLS

Handoff means no tools.

Once the transfer line is spoken, the agent may not look up a slot or book anything. The only allowed response is the transfer itself.

voice_agents / gemini_live_dental_fr / system_prompt.md

> **HANDOFF MEANS NO TOOLS.** When the caller says "operator", "human", "speak to someone", or you transfer for any reason (emergency, English-only mismatch, hostile caller, repeated unclear audio after 2 spell-back tries, tool failure), your response is **ONLY the transfer line**. Do **NOT** call `list_slots`. Do **NOT** call `book_slot`.

RULE 4 · WHAT THE HUMAN RECEIVES

Caller context, reason, transcript.

Even on the failure path: a duplicate booking comes back as 'duplicate' with the reason, so the caller hears an explanation instead of silence.

voice_agents / vapi_dental_fr / app.py

```
r = await cx.post(f"{CAL_API_BASE}/bookings",
  headers=_cal_headers(), json=payload)
if r.status_code == 409:
    return {"status": "duplicate", "reason":
  r.text[:200]}
r.raise_for_status()
```

What is the exit word in your customer-facing automation, and does it work on the first try?
